

# FAQ

## Are the results permanent?

Results vary with the condition and the degree of chronicity or other mitigating factors, results for many conditions are long standing but certain conditions may require ongoing maintenance.

## Are there any side effects?

Side effects may be increased urination and drowsiness from increased diuresis and relaxation. Patients are encouraged to drink plenty of water before and after a therapy session.

## When do patients feel the results?

Many of the results are felt immediately after reaching target temperature with some neurological results lagging by as much as one-two weeks later.

## How are NICE Therapeutics™ different from Laser?

- We don't burn
- We don't blind
- We reach deeper tissue depths of >15cm
- We provide more power to the tissue
- You don't have to constantly reposition the applicator

## How is it different to a TENS machine?

A TENS unit sends an electrical current across two superficial electrodes. Our units use a forward facing applicator to send modulated frequency energy into the body.

## How is it different to Shockwave Therapy & Therapeutic Ultrasound?

Shockwave therapy uses sound waves to produce heat and is not intended for use around some areas. NICE Therapeutics™ use UHF (Ultra High Frequency) as a carrier wave and introduces UHF modulated signals into the body which can be used safely around bone and the bodies tissues. Like therapeutic ultrasound NICE Therapeutics™ use periodic oscillation but in the UHF range which allows for deeper safer penetration and the introduction of low frequency modulation.

NON INVASIVE CELLULAR ELECTROCEUTICALS

By INNOVARIUS

## Our Mission

"To relieve pain & suffering while elevating the standard level of care"

# When Being NICE Really Matters

# INNOVARIUS

Innovation for the next paradigm

## NICE Therapeutics™

Non Invasive Cellular Electroceuticals

### What is it?

NICE Therapeutics™ are a healing modality that activates and accelerates molecular motion through electromagnetic resonance. This molecular motion induces hyperthermia which causes an increase in blood vessel size, increasing blood flow locally, thereby, promoting a more efficient delivery of oxygen, nutrients, plasma rich proteins and the rapid removal of toxins and inflammation in the targeted areas. The system accelerates the healing process at depths of penetration not observed with other treatment modalities.

### NICE Therapeutics™

Rapid clinical responses in multiple domains are possible by the simple and effective application of NICE Therapeutics™. This results in a **Non-Invasive** vasodilation of arterioles, veins and lymphatic vessels, providing increased blood flow into and out of the heated region, delivering plasma rich proteins, oxygen and draining edema. An effect of this nanotechnology is to vibrate the area being treated free of cellular mediators of inflammation and to stimulate the production of the Heat Shock Protein 70 and other repair molecules through PEMF. Veterinarians find that once they implement the technology as a stand-alone or combined therapy in practice that they cannot work without it. NICE Therapeutics™ are .....**clinically addictive!**

### How does it work?

A non-invasive applicator pad is applied to the problematic area suspected of causing the pain or loss of function. The patient will feel the sensation of warmth in the area being treated like a heating pad. NICE Therapeutics™ was developed by the INNOVARIUS Global Team.

NICE Therapeutics™ are based and developed on comprehensive solid science, clinical studies & trials involving cancer therapy, neurological injury, soft tissue injury, sports medicine and rehabilitation. We have confirmed its safety and efficacy in active clinical settings. Veterinarians now have a technology that truly represents a paradigm shift for pain management, rehabilitation & scientifically-based natural healing.
